	Asset# 1002 (antenna)	17.2	
Reported QuasiPeak Final Measurement (dB μ V/m) @ 30MHz			11.8

1.10.3 Spurious Radiated Emission – Substitution Method

Example = 84dB μ V/m @ 1413 MHz (numerical sample only)

The field strength reading of 84dB μ V/m @ 1413 MHz (2nd Harmonic of 706.5 MHz) is the maximized measurement when the EUT is on the turntable measured at 3 meters. The gain of the substituted antenna is 7.8dBi while the transmit cable loss is 1.0 dB (cable between signal generator and the substituted antenna). The signal generator level is adjusted until the 84dB μ V/m level at the receiving end is replicated (identical test setup, i.e. same antenna, cable/s and preamp). If the adjusted signal generator level is -18dBm, then we have the following for both EIRP and ERP as required:

$$\begin{aligned}
 P_{\text{EIRP}} &= -18 \text{ dBm} + 7.8 \text{ dBi} - 1 \text{ dB} \\
 &= 11.2 \text{ dBm} \\
 P_{\text{ERP}} &= P_{\text{EIRP}} - 2.15 \text{ dB} \\
 &= 11.2 \text{ dBm} - 2.15 \text{ dB} \\
 &= 9.05 \text{ dBm}

2.2.4 Date of Test/Initial of test personnel who performed the test

2.2.5 Additional Observations

- ERP and EIRP were calculated as per Section 1.2 and 1.3 of KDB412172 D01 (Determining ERP and EIRP v01).
- Calculation formula in logarithmic terms:

$$\text{ERP or EIRP} = P_T + G_T - L_c$$

Where:

P_T = transmitter output power, expressed in dBm (Section 2.1 of this test report)

G_T = gain of the transmitting antenna, in dBd (ERP) or dBi (EIRP);

$$G_T(\text{dBd}) = G_T(\text{dBi}) - 2.15 \text{ dB}$$

L_c = signal attenuation in the connecting cable between the transmitter and antenna, in dB.

2.2.6 Sample Computation

$$\begin{aligned} \text{ERP} &= P_T + G_T - L_c - 2.15 \text{ dB} \\ &= 29.87 \text{ (Peak)} + 0.13 \text{ (max. gain)} - 3.84 \text{ (cable loss)} - 2.15 \\ &= 24.01 \text{ dBm} \end{aligned}$$

$$\begin{aligned} \text{EIRP} &= P_T + G_T - L_c \\ &= 29.87 \text{ (Peak)} + 0.13 \text{ (max. gain)} - 3.84 \text{ (cable loss)} \\ &= 26.16 \text{ dBm} \end{aligned}$$

The transmitted signal bandwidth shall be reported as the 99% emission bandwidth, that is the frequency bandwidth such that, below its lower and above its upper frequency limits, the mean powers radiated are each equal to 0.5 percent of the total mean power radiated by a given emission.

26dB Bandwidth is defined as the width of the signal between two points, one below the carrier center frequency and one above the carrier center frequency, outside of which all emissions are attenuated by at least 26 dB below the transmitter power.

Using the occupied bandwidth measurement function in the spectrum analyzer, the 99% occupied bandwidth was measured.

In addition, the 26dB bandwidth was measured in accordance with FCC KDB 971168 D01 V0202 Clause 4.1 using the ndB measurement function in the spectrum analyzer.

- The transmitter shall be operated at its maximum carrier power measured under normal test conditions.
- The span of the analyzer shall be set to capture all products of the modulation process, including the emission skirts.
- The resolution bandwidth (RBW) shall be in the range of 1% to 5% of the occupied bandwidth (OBW) and video bandwidth (VBW) shall be at least 3x RBW.

Test performed at TÜV SÜD America Inc. Rancho Bernardo facility.

Ambient Temperature	24.6°C
Relative Humidity	60.2%
ATM Pressure	98.8kPa

2.4.7 Additional Observations

- This is a conducted test.
- As per FCC KDB 971168 D01 v03r01 clause 5.7, the PAPR was measured in accordance with ANSI C63.26 clause 5.2.3.4.
- The transducer factor (TDF) used is from the external attenuators and cables used.
- Measurement was done using the Spectrum Analyzer's Complementary Cumulative Distribution Function (CCDF) measurement profile. The built-in function is used to determine the largest deviation between the average and the peak power of the EUT in a given bandwidth (crest factor or peak-to-average ratio). A CCDF curve depicts the probability of the peak signal amplitude exceeding the average power level. Most contemporary measurement instrumentation include the capability to produce CCDF curves for an input signal provided that the instrument's resolution bandwidth can be set wide enough to accommodate the entire input signal bandwidth.
- Low, Middle and High channels for all bandwidths were verified.
- RBW was set to maximum the SA can support.
- There are no measured PAR levels greater than 13dB.

2.8.2 Standard Applicable

FCC 47 CFR Part 27, Clause 27.54:
The frequency stability shall be sufficient to ensure that the fundamental emissions stay within the authorized bands of operation.

RSS-130, Clause 4.3:
The transmitter frequency stability limit shall be determined as follows:
(a) The frequency offset shall be measured according to the procedure described in RSS-Gen and recorded;
(b) Using a resolution bandwidth of 1% of the occupied bandwidth, a reference point at the unwanted emission level which complies with the attenuation of $43 + 10 \log_{10} p$ (watts) on the emission mask of the lowest and highest channel shall be selected, and the frequency at these points shall be recorded as f_L and f_H respectively.

The applicant shall ensure frequency stability by showing that f_L minus the frequency offset and f_H plus the frequency offset shall be within the frequency range in which the equipment is designed to operate.

RSS-131, Clause 5.2.4
Industrial zone enhancers shall comply with the frequency stability given in the RSS that applies to the equipment with which the zone enhancer is to be used. In cases where the frequency stability limit is not given in the applicable RSS, the equipment shall comply with a frequency stability of ± 1.5 ppm.

September 25 and 26, 2018/XYZ

2.8.5 Test Equipment Used

Ambient Temperature	24.5 - 25.0°C
Relative Humidity	50.3 - 53.8%
ATM Pressure	98.9 - 99.0kPa

2.8.7 Additional Observations

- This is a conducted test.
- The EUT was operated at 120.0VAC nominal voltage and was placed in the temperature chamber for the series of evaluations performed.
- Test performed in 10 MHz Bandwidth Middle channel as the representative configuration.
- Input Type "Tones" was selected and the EUT was injected a CW signal from a Signal Generator and maximum frequency error was monitored using the spectrum analyzer.
- The Temperature was reduced to -30°C and allowed to sit for 1 hour to allow the equipment and chamber temperature to stabilize. The measurements on both downlink and uplink were then performed. The temperature was then increased by 10°C steps and allowed to settle before taking the next set of measurements. The EUT was tested over the temperature -30°C to +50°C.
- Voltage variation was also performed at 85% and 115% of the nominal voltage.

The major items of test equipment used for the above tests are identified in Section 3.1.

2.11.6 Environmental Conditions/ Test Location

Test performed at TÜV SÜD America Inc. Rancho Bernardo facility

Ambient Temperature	24.7°C
Relative Humidity	21.0%
ATM Pressure	98.9kPa

2.11.7 Additional Observations

- This is a conducted test.
- The path loss was measured and entered as an offset.
- A swept CW signal whose frequency range is $\pm 250\%$ of the manufacturer's specified pass band is configured for the testing.
- The CW is 3 dB below the ACG threshold (determined according to section 3.2 of the current KDB), and doesn't activate the AGC threshold throughout the test.
- Dwell time is 10 ms.
- Frequency Step is 50 kHz.
- RBW is between 1% and 5% of the manufacturer's rated pass band.
- VBW is 3 x RBW.
- Detector is peak and trace is max hold.

- The peak amplitude frequency f_0 is determined and two additional -20 dB markers are determined using the marker-delta method).
- The 20dB Bandwidth plot is recorded as the out-of-band rejection frequency response.
- Both downlink and uplink are tested.

Test performed at TÜV SÜD America Inc. Rancho Bernardo facility

Ambient Temperature	24.9°C
Relative Humidity	50.4%
ATM Pressure	98.5kPa

2.12.7 Additional Observations

- This is a conducted test.
- The path loss was measured and entered as an offset.
- The EUT only support LTE 10 MHz Bandwidth, so the signal generator is configured to transmit the applicable signal type: 10 MHz LTE.
- The signal amplitude is just below the ACG threshold (determined according to section 3.2 of the current KDB), and not more than 0.5 dB below.
- Span is between 2 times to 5 times the emission bandwidth (EBW) or alternatively, the OBW.
- RBW is between 1% and 5% of the anticipated OBW
- VBW is $\geq 3 \times$ RBW.

- Set the reference level of spectrum analyzer so that the peak of the spectral envelope is more than $10\log(\text{OBW}/\text{RBW})$ below the reference level.
- The noise floor of the spectrum analyzer at the selected RBW is at least 36 dB below the reference level.
- Detector is positive peak and trace is max hold.
- The peak amplitude frequency f_0 is determined and two additional -26 dB markers are determined and -26 dB EBW is determined using n dB function of spectrum analyzer.
- Repeat the testing with the input signal connected directly to the spectrum analyzer.
- Compare the spectral plot of the input signal to the output signal.
- Repeat the testing with input signal amplitude set to 3 dB above AGC threshold and Narrowband signal (representative of a GSM signal).
- Both downlink and uplink are tested.

2.12.8 Test Results

Compliant. The spectral growth of 26 dB bandwidth of the output signal is less than 5% of the input signal spectrum.

LTE Band 14 Downlink							
Signal Type / Level	Bandwidth (MHz)	Channel	Frequency (MHz)	99% OBW (MHz)		-26 dB BW (MHz)	
				Output	Input*	Output	Input*
LTE 10 MHz BW signal at AGC Threshold Level	10	5095	737.5	8.792	8.964	9.35	9.82
LTE 10 MHz BW signal at AGC + 3 dB Level				8.787	8.964	9.34	9.82
Narrowband signal at AGC Threshold Level				0.261	0.254	0.301	0.301
Narrowband signal at AGC + 3 dB Level				0.253	0.254	0.296	0.301

* Since the AGC Threshold level and AGC + 3 dB level for downlink are as low as -75 dBm, which is about the noise floor, the input levels are adjusted in order to get the right input 99% OBW and -26 dB BW when testing.

LTE Band 14 Uplink							
Signal Type / Level	Bandwidth (MHz)	Channel	Frequency (MHz)	99% OBW (MHz)		-26 dB BW (MHz)	
				Output	Input*	Output	Input*
LTE 10 MHz BW signal at AGC Threshold Level	10	23095	707.5	8.777	8.971	9.35	9.91

Narrowband signal at AGC Threshold Level				0.249	0.253	0.278	0.283
Narrowband signal at AGC + 3 dB Level				0.249	0.253	0.278	0.283

* Since the AGC Threshold level and AGC + 3 dB level for Uplink are as low as -65 dBm, which is close to the noise floor, the input levels are adjusted in order to get the right input 99% OBW and -26 dB BW when testing.
